

Insufficient Memory Error Message When Starting Version 7

If you install PowerChurch Plus Version 7 on a computer that has 768 MB of RAM or more, there is a known issue in Microsoft Visual FoxPro 3.0b (which Version 7 was written under) that will cause an "insufficient memory" error message as soon as you try to start the program. This issue would affect any computer with 768 MB of RAM or more, regardless of the Operating System.

This issue is a documented problem with Microsoft Visual FoxPro 3.0b and a Knowledge Base article is available on Microsoft's web site that describes it in more detail. This document is available [here](#).

Unfortunately, there is not any way for us to fix this problem and the only solutions are to either limit the amount of available memory or to upgrade to our current release of PowerChurch Plus. Our current release was written under a later version of Microsoft Visual FoxPro and would not be affected by this problem.
